Chapter 11 Markov Chains 11.1 Introduction Most of our study of probability has dealt with independent trials processes. These processes are the basis of classical probability theory and much of statistics.

In probability and statistics, a probability mass function (PMF) is a function that gives the probability that a discrete random variable is exactly equal to some value. The probability mass function is often the primary means of defining a discrete probability distribution, and such functions exist for either scalar or multivariate random variables whose domain is discrete.

To practice risk management effectively, project managers must address its two dimensions: risk probability and risk impact. Although there are unambiguous frameworks for assessing risk impact, the field lacks such a model for assessing probability.

The addition rule helped us solve problems when we performed one task and wanted to know the probability of two things happening during that task. This lesson deals with the multiplication rule. The multiplication rule also deals with two events, but in these problems the events occur as a result of more than one task (rolling one die then another, drawing two cards, spinning a spinner twice ...

Entering the  $X^2$  sum of 23.8872 and the degrees of freedom (32, one less than the 33 possible outcomes of the experiment) into the Chi-Square Calculator gives a probability of 0.85. This falls within the "fat region" of the probability curve, and thus supports the null hypothesis, just as we expected. Next, we invite our subject to attempt to influence the random output of our generator.
