

The Cockroach Periplaneta Americana L By Ewen Cameron

The Cockroach Periplaneta Americana L

The American cockroach (*Periplaneta americana*) is the largest species of common cockroach, and often considered a pest. In certain regions of the U.S. it is colloquially known as the waterbug, though it is not a true waterbug since it is not aquatic. It is also known as the ship cockroach, kakerlac, and Bombay canary. It is often misidentified as a palmetto bug.

American cockroach - Wikipedia

Most species of cockroach are about the size of a thumbnail, but several species are bigger. The world's heaviest cockroach is the Australian giant burrowing cockroach *Macropanesthia rhinoceros*, which can reach 9 cm (3.5 in) in length and weigh more than 30 g (1.1 oz). Comparable in size is the Central American giant cockroach *Blaberus giganteus*, which grows to a similar length.

Although reared in captivity from time immemorial, modern farming of this species originated in the early 1960s when FAO expert Shao-Wen Ling, working in Malaysia, found that freshwater prawn (*Macrobrachium rosenbergii*) larvae required brackish conditions for survival. This discovery led to larval rearing on an experimental basis.

As farmer Li Bingcai opened the door to his cockroach farm in southwest China, an insect the size of a dart flew into his face. Picking the critter off his forehead, he tossed it back into the dark room where some 10 million more of its kind scurried around, housed in wooden frames perched on shelves. In pic: A cockroach farmer Li Bingcai eating an exuvial roach at his farm in Yibin, China's ...

Les blattes et les termites appartiennent à l'ordre des blattoptères (Blattodea). La classification de ces groupes est encore sujette à différentes hypothèses. L'une d'entre elles voudrait qu'ils soient inclus avec les mantes dans l'ordre des Dictyoptera. D'autres voudraient les séparer complètement, les blattes faisant partie de l'ordre des Blattodea et les termites de l'ordre des Isoptera.

Die Schaben (Blattodea) sind eine Ordnung hemimetaboler Insekten, die mit ca. 4600 Arten vor allem die Tropen und Subtropen besiedeln. Daneben finden sich einige, in menschliche Behausungen eingeschleppte Arten, die dann als Schädlinge oder zumindest als lästig gelten. Schaben haben mittlerweile auch Einzug in die Terraristik gefunden. Teilweise werden sie hier als Futtermittel für andere ...
